

## **IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER**

ESTE INFORME CONTIENE INFORMACION MUY IMPORTANTE SOBRE SU AGUA DE BEBER.  
TRADUZCALO O HABLE CON ALGUIEN QUE LO ENTIENDA BIEN.

The Highridge Water Authority (HWA), which serves people in Derry Township, Westmoreland County, recently exceeded the drinking water standard for Haloacetic Acids (HAAs). Although this incident was not an emergency, as our customers, you have the right to know what happened and what we did to correct this situation.

Your drinking water is routinely monitored for the presence of many drinking water contaminants. Monitoring results received for the Fourth Quarter 2019 indicated that a portion of the water system serving the Brenizer, Cokeville, and Sundial area exceeded the standard or maximum contaminant level (MCL) for HAAs.

The standard or MCL for HAAs is 60 parts per billion (ppb) based on a running annual average from quarterly sampling. Fourth quarter testing results caused this standard to be exceeded by 6 ppb. (Analogies for 1 ppb would be one sheet of toilet paper in a roll of paper stretching from New York to London, one pinch of salt in 10 tons of potato chips, or 1 second in nearly 32 years.)

**You do not need to use an alternative drinking water supply such as bottled water.** However, if you have specific health concerns, consult your doctor. This is not an immediate risk. If it had been, you would have been notified immediately. Some people who drink water contaminated with HAAs in excess of the MCL **over many years** may have an increased risk of getting cancer.

HWA treats its surface water source and uses chlorine for disinfection prior to distribution to its customers. Chlorination is the preferred method of public water disinfection and has been in use worldwide for over a century to eliminate such waterborne diseases as cholera and dysentery. Unfortunately, some of the chlorine used for disinfection combines with organic matter naturally present in the surface water to form chemicals called disinfection byproducts (DBP's), including HAAs. The U.S. Environmental Protection Agency established the Disinfectant/Disinfection Byproducts Rule to control DBP levels in drinking water. However, the Rule recognizes the risk of disease from drinking water that is not disinfected is more immediate than the increased risk of getting cancer from drinking water containing disinfection byproducts over many years.

Plans are being formulated to make sure this occurrence is not repeated.
